INTRODUCTION

COMPANY PROFILE

Allied Concrete have over 50 concrete plants throughout the country as well as several mobile plants. With over 400 trucks in their modern fleet and more than 500 staff, Allied Concrete continually apply new technology to ensure they have state-of-the-art technical equipment to create products and transport them to customers.

Allied Concrete is regarded as a technical leader in New Zealand, through award winning technical and operational expertise, high quality and innovative concrete solutions, strict quality standards and capacity to supply large volumes of concrete.

WHAT IS AN EPD

An Environmental Product Declaration (EPD) is an independently verified and registered document that communicates transparent and comparable data and other relevant environmental information about the life-cycle environmental impact of a product. EPD's allow manufacturers to report quantified environmental performance information for their products.

All EPDs registered with EPD Australasia Limited are publicly available and mutually recognised within the International EPD® System, ensuring global alignment and broad market visibility.

This EPD has been prepared in accordance with ISO 14025: 2006, EN 15804: 2013, EN 16757: 2017 (CEN, 2017), and PCR 2012:01 (International EPD® System; 2018). In addition it meets the requirements of The International EPD® System (2015) and EPD Australasia (2017). It covers pump and standard grades of Normal ready mixed concrete at compressive strengths between 17.5 MPa, 50 MPa, and special ready mixed concrete at 50 MPa, produced in accordance with NZS 3104: 2003 at batching plants illustrated on the map on page 4.

Allied Concrete has sole ownership, liability and responsibility for this EPD.

RESULTS PRESENTED IN THIS EPD:

- Have a cradle to gate system boundary (see the LCA Calculation section) because other stages are very dependent on particular scenarios and are better developed for specific building or construction works.
- EPD of construction products may not be comparable if they do not comply with the requirements of comparability set in EN 15804: 2013. EPDs within the same product category but from different programmes may not be comparable.
- Are averages by compressive strength, weighted by volumes produced at batching plants covered by this EPD during the twelve months of 2017.
- Are representative of Allied Concrete batching plants wholly supplied in 2017 by Holcim (New Zealand) Ltd cement.
- Are not representative of ready mixed concrete from any other Allied Concrete batching plants.

GREEN STAR COMPLIANCE

Because this EPD is product-specific and meets the following criteria it is recognised by Green Star (New Zealand).

- Cradle to gate system
- Is EN15804-compliant
- Third party-verified

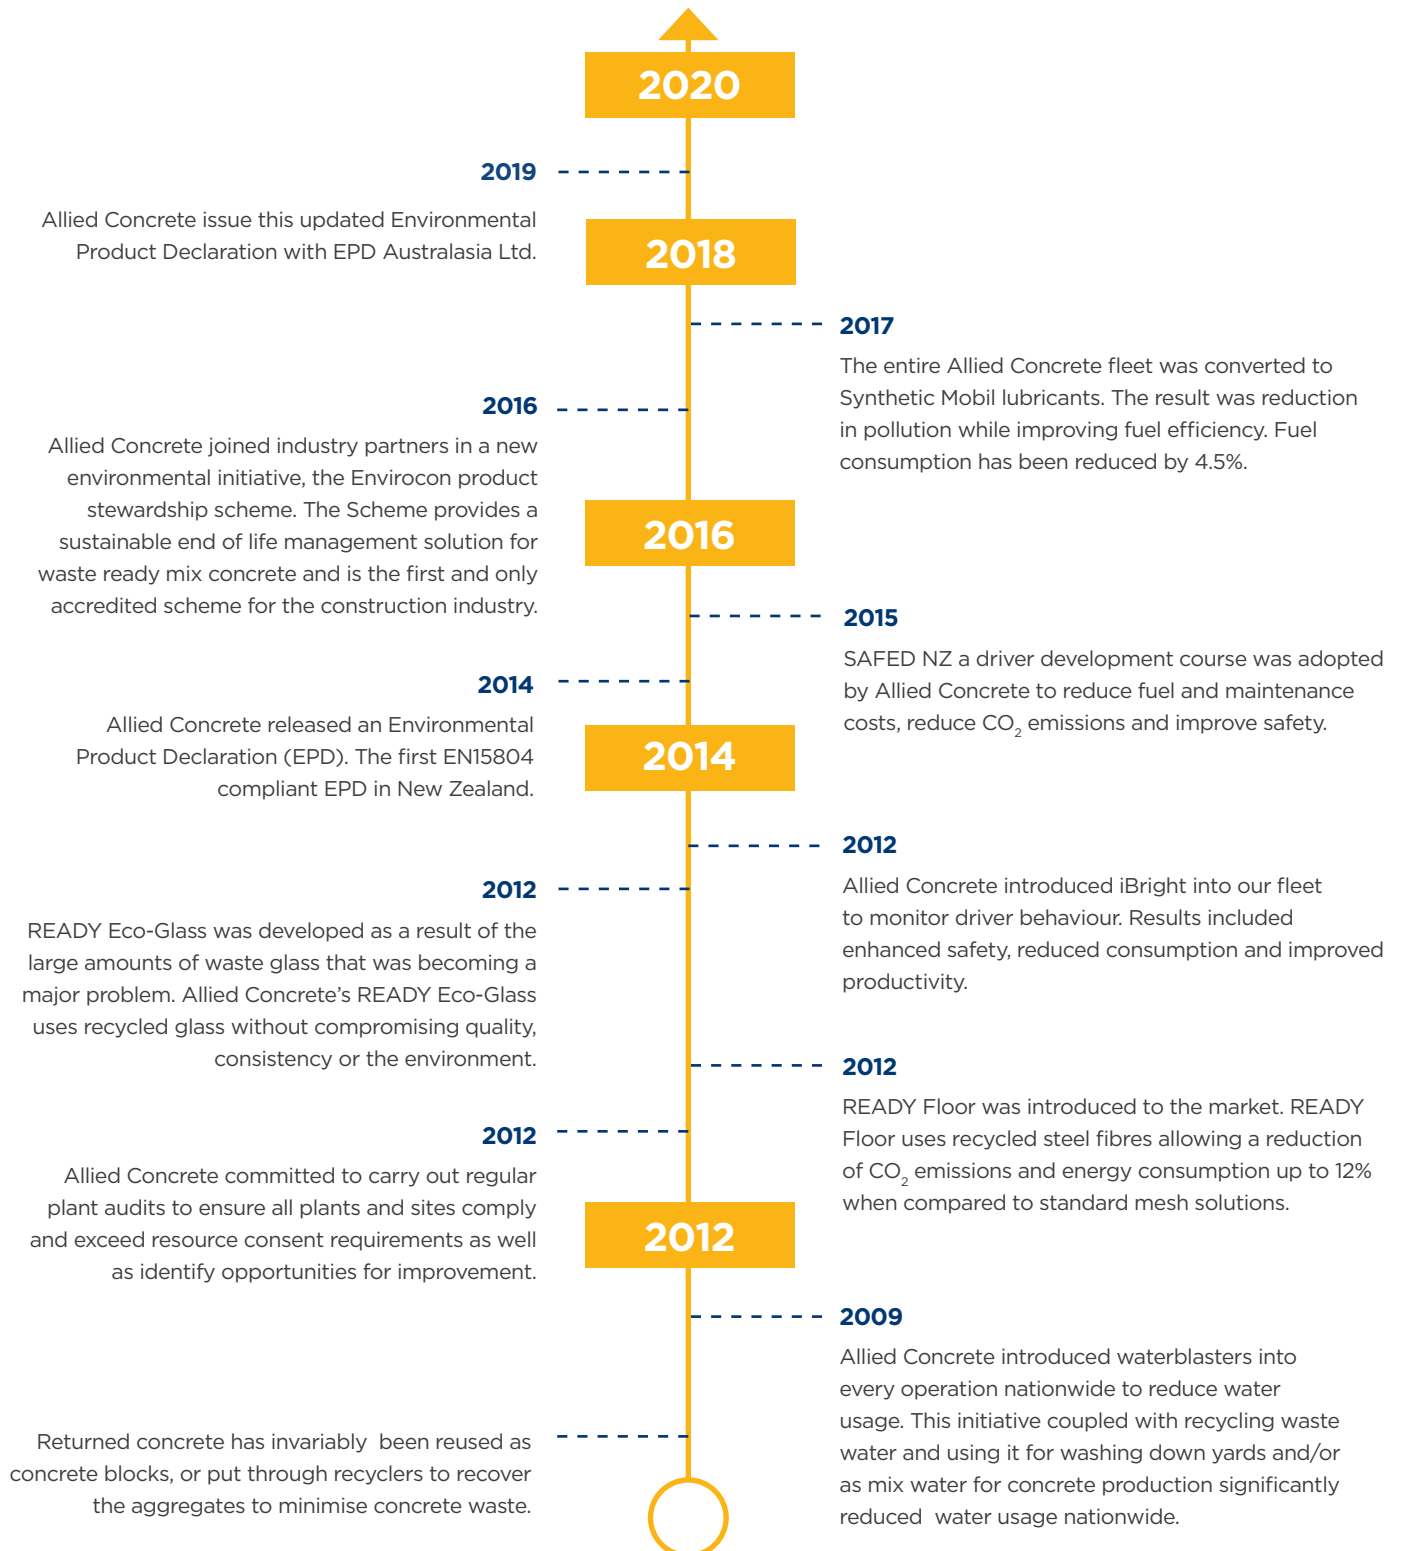

BATCHING PLANTS INCLUDED IN EPD

SUSTAINABILITY

The company's view is that sustainability is all about meeting the needs of today, without adversely impacting on the needs of tomorrow. Allied Concrete apply this philosophy across a wide range of areas that influence business such as the environment, society and the economy.

We are mindful that the work we do could have a negative impact on the environment if we do not operate in an efficient manner. To this end we continue to monitor sites and carry out regular audits to ensure all sites are compliant and are meeting all resource consent conditions. Allied Concrete aim to minimise the use of resources and energy, every day through the following initiatives:

HEALTH AND SAFETY

It is important to take all necessary safety precautions when dealing with ready-mixed concrete due to its alkaline composition.

The caustic nature of fresh concrete can cause contact dermatitis, an inflammatory skin condition caused by certain irritants contained in many industrial materials. The cement in concrete physically damages the skin (the damage is characterized by red, itchy skin that can become blistered and weepy).

The dermatitis reaction of the skin will vary from one person to another; the reaction may be only a mild redness in less severe cases, but this can develop into swelling, blisters and septic ulcers that are both unsightly and painful.

The use of protective clothing is recommended and where it is provided (such as overalls and gloves), it must be of the right type to protect the wearer against the absorption of alkaline moisture from the concrete (protective clothing which remains damp and in skin contact can severely exacerbate dermatitis symptoms). Allied Concrete offers advice on the most suitable gloves for specific types of hazard. Note that when using gloves to help prevent dermatitis, users must avoid getting contaminants inside the gloves when putting them on and taking them off. It is

also important to provide washing facilities, with a supply of hot and cold (or warm) running water, soap and a means of drying the hands, to help prevent dermatitis.

As a secondary precaution the use of barrier creams will also assist in the mitigation of any dermatitis risk beyond the protection offered by the safety clothing.

HAZARDOUS SUBSTANCES AND NEW ORGANISMS ACT HSNO DECLARATION.

The concretes manufactured under this EPD are made with cement which is classified as hazardous according to the criteria HS (Minimum Degrees of Hazard) Regulations 2001.

The HSNO Group Standard is: Construction Products (Corrosive 8.2C) Group Standard.

Hazard Classification: 6.1D; 6.5A; 6.5B; 8.2C; 8.3A.

Environmental hazards associated with the use of these concretes is covered in the NZRMCA publications "On site Management of Concrete Washwater" and "Ready-mixed Concrete Driver Responsibilities for the On Site Management of Concrete Washwater" which can be downloaded from the NZRMCA website (www.nzrmca.org.nz).

OUR PRODUCTS

OUR PRODUCT

PRODUCT DESCRIPTION

Ready mixed concrete is produced at batching plants where controlled operations allow precise mix designs resulting in a product that is delivered to construction sites in a freshly mixed, plastic or unhardened state. Concretes categorised as Normal and Special are defined and made in accordance with NZS 3104:2003, to ensure that nominal strengths are achieved. This Standard defines the production and testing regime necessary to achieve the target strengths for concretes from 17.5 to 50 MPa.

Concretes covered by this EPD are constituted from cement, coarse and fine aggregates, secondary materials, recycled or fresh water and admixtures, proportioned to exceed the target strength for the respective strength classes for this EPD.

The weighted average composition by mass of ready mixed concretes in this EPD are as follows:

Cement (Holcim supplied):	12%
Coarse and fine aggregates:	81%
Secondary materials:	<0.1%
Water (fresh or recycled):	7%
Admixtures:	<0.1%

All concretes are truck mixed prior to dispatch from batching plants with the exception of concretes produced from Avondale, East Tamaki, Dunedin, Mosgiel, and Wanganui where central mixers (tilting drum, pan or twin shaft) are used.

The materials used in the concretes covered by this EPD are as follows:

- **Cement:** Cement is imported by Holcim from a Mitsubishi Materials Corporation (MMC) cement plant in Japan. Cement production follows a two stage process. In the first stage, raw materials (primarily limestone, silica sand and fly ash) are heated to

produce clinker. In the second stage, the clinker, together with limestone, gypsum, slag and grinding aids are ground to produce cement (under Holcim's brand name Ultracem). Ultracem is transported via ship to Holcim's two import terminals in Auckland and Timaru, from there it is transported via distribution depots to the batching plants covered by this EPD.

- **Aggregates:** These are a variety of materials that can be broadly classified as either manufactured, or naturally derived (alluvial). Coarse and fine aggregates meet the production requirements of NZS 3121:1986. Demolition-based aggregates are not used in concretes covered by this EPD.
- **Natural pozzolans:** Where incorporated in mixes, this is micro-silica.
- **Secondary materials:** Where incorporated in mixes, they consist of fly ash (a byproduct of coal combustion) and silica fume (a byproduct of the metals industry).
- **Water:** May be fresh (from a reticulated network or bore) or recycled, depending on the mix design.
- **Admixtures:** These meet either NZS 3113: 1979 or AS 1478:2005 and are used to improve fresh concrete properties (slump retention, workability, early strength).

PROPERTIES

Typical physical properties of the concretes covered by this EPD are shown in Table 1.

Properties of the concretes are defined in NZS 3109: 1997 for workability, and NZS 3104: 2003 which requires that not more than 5% of all concretes produced fall below the nominal strength.

Minimum levels of cover required for different exposure classes to achieve expected service lifetimes of 50 and 100 years are set out in NZS 3101:2006. Table 1 provides examples for A1 and B2 exposure classes.

TABLE 1. PHYSICAL PROPERTIES OF CONCRETES COVERED BY THIS EPD

	Exposure Class B2	-/-	-/-	-/-	45/65	40/55	35/50	30/45	30/40	30/40	mm	Table 3.6 & 3.7 NZS 3101
	Exposure Class C	-/-	-/-	-/-	-/-	-/-	-/-	-/-	-/-	60/60	mm	Table 3.6 & 3.7 NZS 3101

Note: the aggregates used in concretes covered by the EPD use a variety of aggregate types. For simplicity reasons we have used technical data from two geological sources, viz. *greywacke and **basalt.

FIRE RESISTANCE OF CONCRETE

Concrete has good fire resistance properties in use. This performance is due to concrete’s constituent materials (cement and aggregates) which, when chemically combined within concrete, form a material that is essentially inert and, most importantly, has relatively poor thermal conductivity.

This property (a slow rate of conductivity (heat transfer)) enables concrete to act as a combustion and heat shield between adjacent spaces.

This same property also protects concrete from damage during a fire, with extended times whereby the structure can be subjected to high temperatures yet still perform structurally without the risk of sudden collapse.

ACOUSTIC PERFORMANCE OF CONCRETE

The acoustic performance of concrete is determined by its ability to attenuate sound energy, which is directly linked to its mass. Good sound insulation by walls and floors is achieved using the inherent mass and damping qualities of concrete.

APPLICATION

The ready-mixed concrete covered by this EPD can be used in all structures and building elements that comprise the built environment, from residential and light commercial applications to commercial high rise and infrastructural uses, including landscaping applications.

QUALITY CONTROL

Concretes are sampled and tested to ensure compliance with NZS 3104:2003 and NZS 3109:1997.

Plant Engineers certify on a three monthly basis that all testing is being carried out as required, and plants are audited by the concretenz Plant Audit Committee under Plant Audit Scheme for audit of concrete production plants.

PRODUCT LIFECYCLE ASSESSMENT

DECLARED UNIT

The declared unit is 1m³ of pump and standard grades of Normal ready mixed concrete at 17.5 MPa, 20 MPa, 25 MPa, 30 MPa, 35 MPa, 40 MPa, 45 MPa, 50 MPa and Special ready mixed concrete at 50 MPa compressive strengths, produced with cement supplied by Holcim (New Zealand) Ltd.

From NZS 3104:2003, compressive strength is normally at age 28 days unless stated otherwise, which classifies a concrete for purposes of design and construction.

The level of compressive strength is required to be equalled or exceeded by 95% of the concrete produced.

SYSTEM BOUNDARY

This is a cradle to gate EPD comprising processes in Figure 1. In this study, the system boundary includes raw material acquisition (A1), transport to batching plants (A2) and batching plants operation (A3).

The MMC cement plant acquires limestone and silica sand from a nearby quarry, while all other raw materials are either trucked or shipped in.

The cement plant operates a “dry process” wherein raw materials are dried and milled together then fed into the

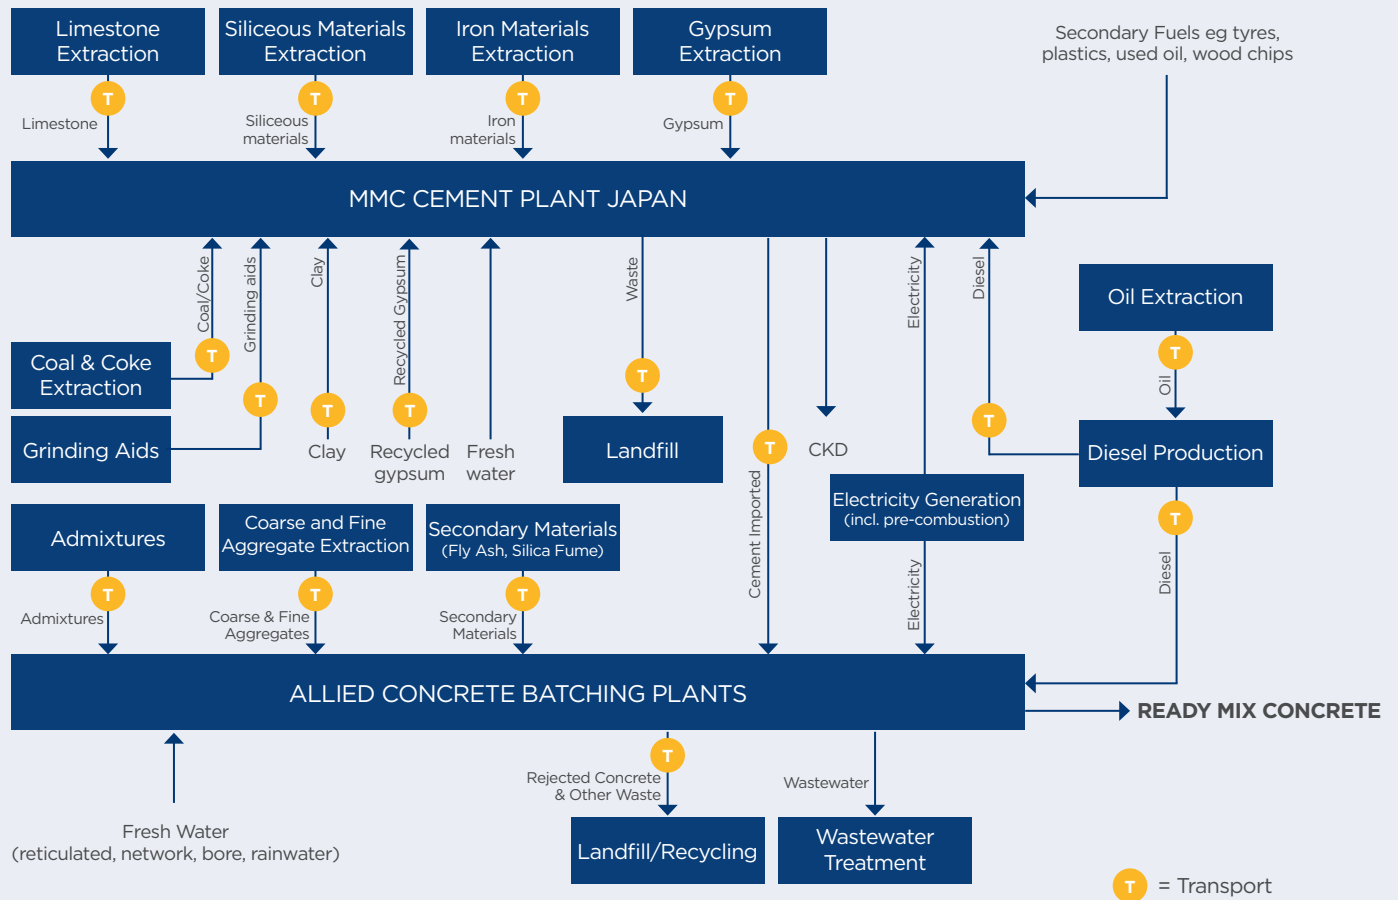

upper end of a rotary kiln. The lower end of the kiln is heated using a variety of fuels, primarily coal but also a range of alternative recycled fuel sources; including wood chips, plastics, fluids, tyres, garbage and oils. The dry meal is heated as it slowly moves down the kiln until it reaches a temperature of almost 1500°C producing “clinker”. This temperature completely changes the raw materials into new minerals which will react with water to form a cementitious binder. The clinker is subsequently ground with gypsum, slag, limestone and grinding aids, to produce cement (Ultracem) which is shipped to New Zealand and then transported via a distribution network to concrete batching plants.

The MMC plant generates the majority of their own electricity requirements and only a small portion is purchased from the Japan Grid.

In addition to cement, other feedstocks for ready mixed concrete production are fine and coarse aggregates, secondary materials, water and admixture. More information about these can be found in the Product Description section of the EPD. Batching plants primarily use electricity, but also some diesel for loaders and mixing of concrete. Concretes not meeting quality requirements are landfilled.

FIGURE 1 - PROCESS FLOW DIAGRAM

KEY ASSUMPTIONS AND ESTIMATES

The following have been assumed or estimated for this study.

- Electricity, diesel use by loaders, water used in manufacturing and general waste produced at batching plants is the same per m³ of ready mixed concrete, irrespective of compressive strength or whether Normal or Special.
- Out of 44 batching plants, 12 have no metered water intake. An average freshwater input per m³ ready mixed concrete was calculated for sites that are metered, which was applied to unmetered sites according to their production.
- Rainfall on process-related hardstanding areas of batching plants drains to storage ponds where the water is no longer fresh. This captured rainwater is considered as used in the process of manufacturing concrete.
- Wastewater discharges from kitchens and bathrooms at batching plants are based on a per person, per day rate measured at one batching plant. On occasion, excess water from storage ponds was moved by truck mixers to other storage locations or landfill to avoid potential overflow. This is considered as wastewater.

CUT OFF CRITERIA

All raw materials and energy required to make cement and ready mixed concrete are included based on process data from Holcim (for clinker and cement) and Allied Concrete (for ready mixed concrete). Exclusions are:

- Use of carbon dioxide to reduce alkalinity of wastewater discharges, which occurs at the Wellington batching plant only.

These have been tested and found to make a negligible contribution to reported indicators and are therefore excluded.

ALLOCATION

Allied Concrete produces Special as well as Normal ready mixed concretes at its batching plants. Where site total data has been obtained (e.g. for electricity use), this has been allocated based on the volume of total ready mixed concrete production during the year. Allocation to compressive strengths is based on the volumes of each that were produced by each batching plant in 2017.

LCA MODEL

An EPD Tool has been developed for the World Business Council for Sustainable Development Cement Sustainability Initiative (WBSCD CSI) to comply with requirements set out in EN 15804 (CEN, 2012) and EN 16757 (CEN, 2017). The EPD Tool has been independently reviewed against these standards by an International EPD® System and EPD Australasia verifier and has been found to be compliant. In 2019, the responsibility for the EPD Tool shifted from the WBSCD CSI to the Global Cement and Concrete Association (GCCA).

The results in this EPD were calculated using the EPD Tool which uses supporting data, based on Ecolnvent version 3.3, covering:

- Production and distribution of electricity. Data for the Japanese national grid is based on International Energy Agency (IEA) data for 2016 (International Energy Agency, 2016) and the New Zealand national grid data comes from MBIE energy statistics (Ministry of Business Innovation and Employment NZ, 2018).
- Extraction activities (raw materials and fuels)

- Pre-combustion and combustion of fuel for transport by truck and ship.
- Landfill processes

Processes covering the manufacture of cement at the MMC plant in Japan and its transport to New Zealand are reported in a separate Holcim NZ Ltd EPD (number: S-P-00850) registered with EPD Australasia.

All MMC production data (raw material quantities, production quantities, electricity usage etc) comes from MMC's internal database and is independently verified by a third-party reviewer. Data for electricity usage at Holcim NZ depots and transport quantities comes from Holcim NZ's internal SAP database. Allied Concrete batching plant production data (raw materials, production quantities, electricity usage etc) comes from Allied Concrete's internal databases.

LCA SCENARIOS

This EPD reports modules A1 to A3 and therefore does not present scenarios.

SYSTEM BOUNDARY DECLARED IN THIS EPD

RESULTS OF ASSESSMENT

This section presents the potential environmental impact, use of resources and waste production of 1m³ of normal ready mixed concrete at specified strengths for each of our batching plants as per illustration on page 4.

It also includes results for 1m³ of special grade 50 MPa ready mixed concrete.
